

TRADING STRATEGIES

WE USE 2 trading strategies that give us the opportunity to earn regardless of whether the market is rising or falling, they are all-seasonal -

“False Breakout” and **“Breakout”**

False Breakout Trading Strategy

False breakout strategy is a certain regularity in the market that has specific preconditions for its appearance, with the help of which we can reject it.

False breakout is a kind of manipulation by which the market forces market participants to exit stop loss trades, leading the price to the place where they put them, such places are support and resistance levels.

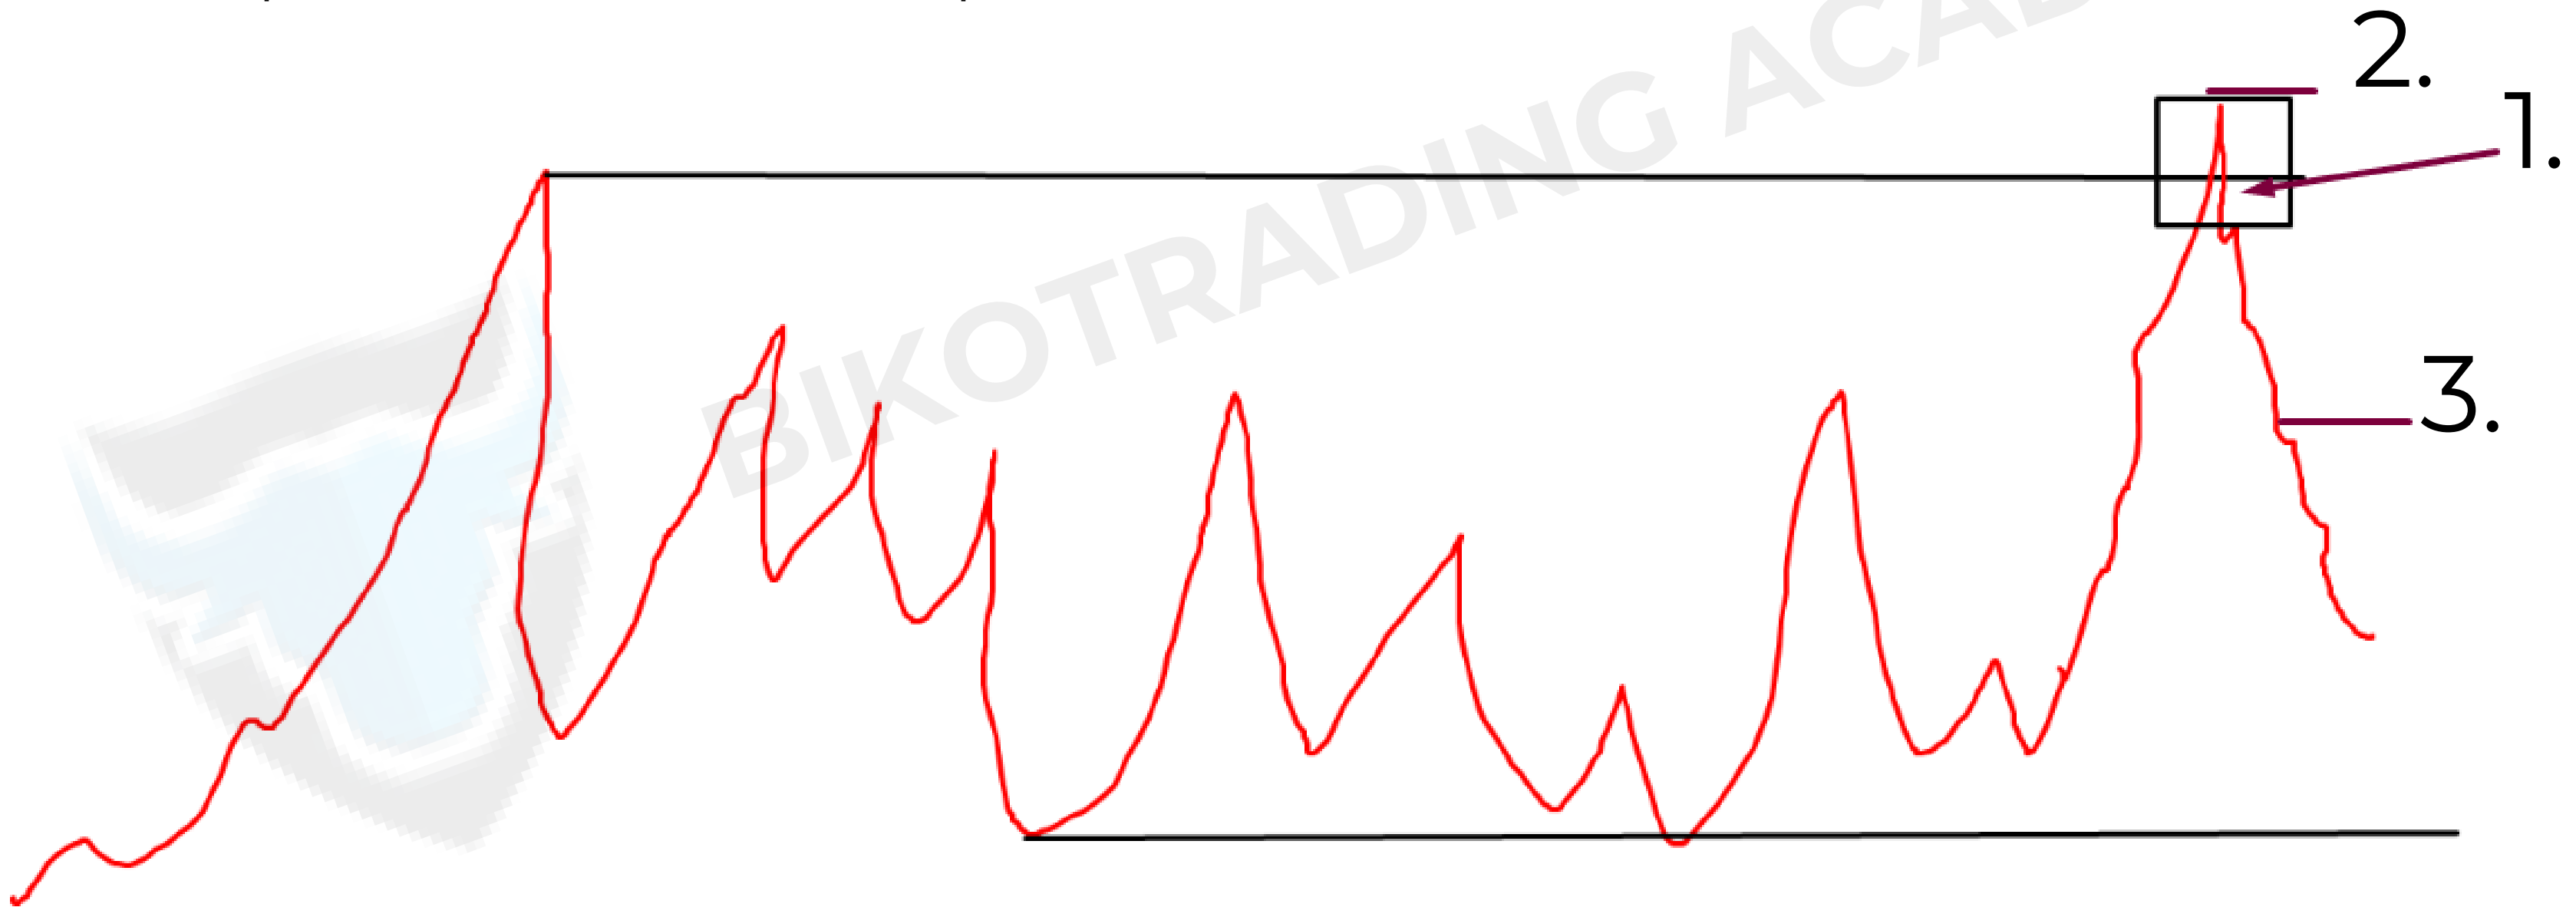

BIKOTRADING ACADEMY

- False breakout

How to trade a false breakout?

1. Wait until the price impulsively approaches the level, breaks it and starts to fall below the level, the volume should be 3-5 times higher than the average at the breakout.
2. Place a stop loss above the top of the false breakout.
3. Take profit is set at a risk-to-profit ratio of 1 to 3.

Let's summarize the preconditions for trading a false breakout:

- 1.** Mark the price levels of support and resistance when the price has formed a range.
- 2.** Wait for the price to quickly and impulsively approach one of the levels.
- 3.** Make sure that a large vertical volume appears when the level is broken.
- 4.** When the price starts to fall below the level, we enter the trade, placing a Stop Loss at the top of the false breakout (the so-called tail of the false breakout). Take Profit is set at 1 to 3.

Breakout Trading Strategy

The breakout strategy is a certain pattern in the market in which large market participants buy a large number of coins when the price is in a range and at one point push the price out of this range.

It is the exit from this range that we will try to catch and make money on this movement. In other words, it is the exit from the accumulation.

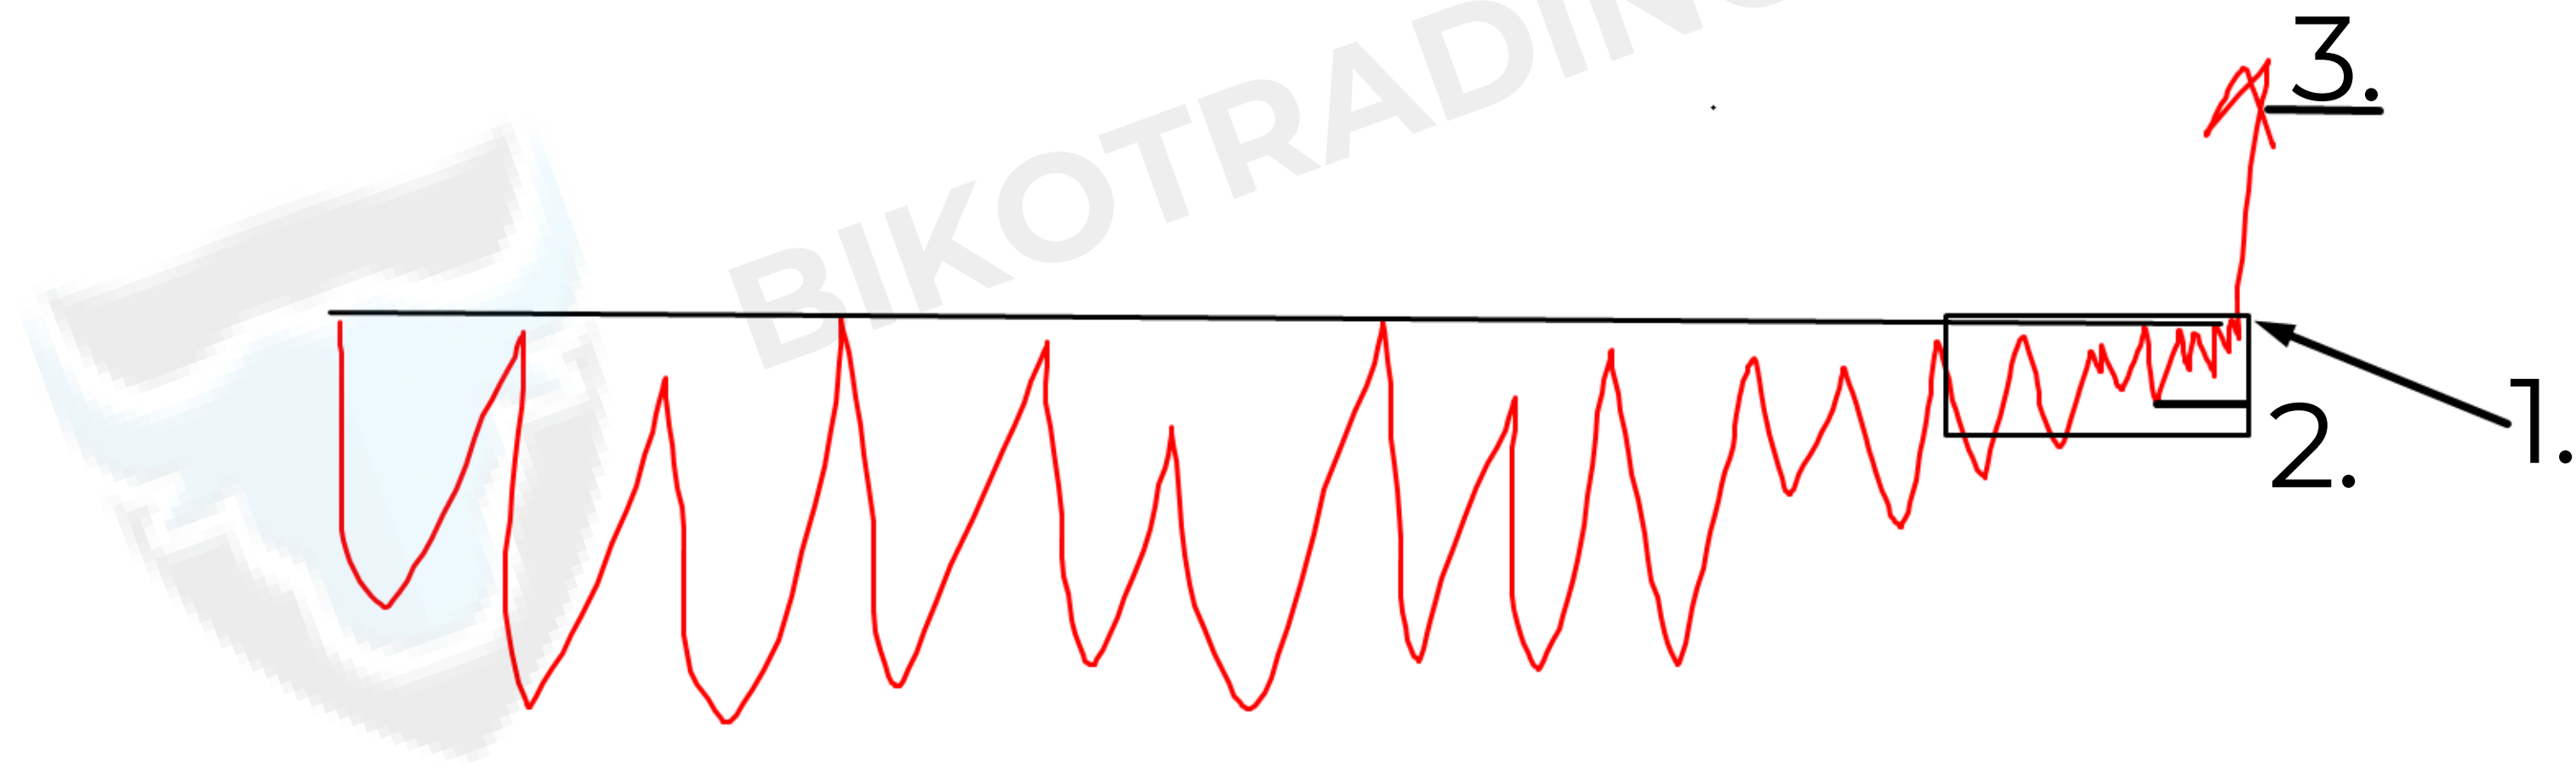

Let's take a look at how it works:

1. The price forms a certain range and stays in it for a long time.
2. Then the price very slowly and smoothly approaches the upper boundary of the range(s) after which the price quickly leaves this range.

How to trade a breakout?

1. Wait until the price smoothly approaches the level or the upper boundary of the range, and starts to stand there for a certain time, i.e., the accumulation before the level will continue, and after the level is broken, enter the trade.
2. Set a stop loss below the last price pullback that occurred.
3. Take profit is set in the ratio of risk to profit of 1 to 3.

Let's summarize the preconditions for breakout trading:

- 1.** Mark the price zones on the chart where the price has formed an accumulation.
- 2.** Wait for the price to smoothly approach one of the zones and start forming a small accumulation there.
- 3.** When the price breaks our level and exits the accumulation, enter the trade.
- 4.** Place a stop loss behind the nearest price pullback and wait for the price to move.
